## What's New

### What Is a Brain SPECT Scan?

A Brain SPECT scan (Single-Photon Emission Computed Tomography) is a specialized imaging test that shows how different areas of the brain are functioning. Unlike standard imaging, SPECT highlights brain activity—revealing areas that are healthy, underactive, or overactive.

### Why It Matters

For many people, mental health conditions can be diagnosed through history and exam alone. But when symptoms are complex, unclear, or treatment-resistant, a Brain SPECT scan can provide valuable insight. It can help identify conditions such as:

- Traumatic brain injury (TBI)
- Stroke
- Dementia
- Long COVID
- Anxiety, depression, OCD
- ADD/ADHD

### How Lone Star Infusion Uses SPECT

At Lone Star Infusion, we take a multidisciplinary approach to care. For patients who have struggled with diagnosis or response to treatment, additional clarity from a Brain SPECT scan can help guide more effective care planning. For more information go to: [What is a Brain SPECT Scan?](#)
